1 Introduction

The following documentation is intended elaborate how the design of the snake game is implemented. The document will also explain how the functional and non-functional requirements mentioned in the Software Requirements Specification will be explained. This document is intended for the following readers:

- Designers: The document can serve to ensure that all functional and non-functional requirements are met. Further, designers can also use this document to verify any discrepancies among different modules.
- New Project Members: This document can bring new team members up-to-date with the overview and structure of the game.
- Maintainers: This document can also used to understand the structure of the game and all of the modules within. It would then be the responsibility of the maintainers to update the Design document by mentioning any change they have made to it.
- Professor and TAs: As this document is being marked, the professors and TAs will have access to the document to determine if it was structured as intended. The document will also serve to give the Professor and the TAs an overview of the modules of the snake game.

The Snake game has been divided up into modules which hide information from other modules in the document in order to implement the Information Hiding principle of Software Engineering. Further, the modules only share the information amongst each other that is necessary. This is done to ensure the Low Coupling principle of Software Engineering. In order to read or modify values within different modules, there are getter and setter methods unique to the respective modules. This is done to implement the Encapsulation principle of Software Engineering.

This document consists of the Module Interface Specification (or MIS) which is intended for programmers who work to further develop the Snake Game.

The rest of this document consists of the GANTT and PERT chart meant to highlight the time frame for future deliverables for development of the Snake Game.

2 Anticipated and Unlikely Changes

There are two types of possible changes: Anticipated and Unlikely Changes. This section covers both of these changes.

2.1 Anticipated Changes

AC1: The specific computer on which the software is running.

AC2: Addition or modification of Keyboard and mouse commands as game is expanded in the future.

AC3: The type of food which the snake eats.

AC4: What must happen after the game is over.

AC5: More options available in the menu as game expands .e.g. save game, high scores, sound, difficulty etc.

AC6: The map of the game.

AC7: Different PowerUps will be available such as Intangibility (.i.e. ability to go through walls) as the game expands.

AC8: The characteristics of the snake .e.g. its color, the way it grows, the speed at which it moves etc.

2.2 Unlikely Changes

These are design decisions that have to be changed after they were fixed in the software architecture state (in order to simplify the design). It wasn't intended that these decisions would have to be changed.

UC1: Input/Output devices (Input: Keyboard, Mouse Output: Screen).

UC2: The game will always be implemented in python using the Pygame library.

UC3: The goal of the game is to get the highest score possible.

3 Module Hierarchy

This section lists the modules in the Snake game. The modules listed below are leaves in the module hierarchy in the table below.

M1: Hardware Hiding Module

M2: Controller Module

M3: Food Module

M4: GameOver Module

M5: MainMenu Module

M6: PlayMap Module

M7: PowerUp Module

M8: Snake Module

The Hardware-Hiding Module is already implemented by the operating system and hence will not be reimplemented.

| Hardware-Hiding Module Behaviour-Hiding Module Behaviour-Hiding Module PlayMap Module PowerUp Module Snake Module Controller Module | Level 1 | Level 2 |
|---|-------------------------|--|
| Behaviour-Hiding Module Behaviour-Hiding Module PlayMap Module PowerUp Module Snake Module | Hardware-Hiding Module | |
| Controller Module | Behaviour-Hiding Module | GameOver Module MainMenu Module PlayMap Module PowerUp Module |
| Software Decision Module | | Controller Module |

Table 1: Module Hierarchy

4 Connection Between Requirements and Design

The table below highlights the connection between the system requirements (which are listed in the Software Requirements Specification) and the modules.

| \mathbf{AC} | Modules | |
|---------------|---------|--|
| AC1 | M1 | |
| AC2 | M2 | |
| AC3 | M3 | |
| AC4 | M4 | |
| AC5 | M5 | |
| AC6 | M6 | |
| AC7 | M7 | |
| AC8 | M8 | |

Table 2: Trace Between Anticipated Changes and Modules

5 Module Decomposition

Modules are decomposed according to the principle of "information hiding" proposed by ?. The *Secrets* field in a module decomposition is a brief statement of the design decision hidden

by the module. The Services field specifies what the module will do without documenting how to do it. For each module, a suggestion for the implementing software is given under the Implemented By title. If the entry is OS, this means that the module is provided by the operating system or by standard programming language libraries. If the entry is Matlab, this means that the module is provided by Matlab. SWHS means the module will be implemented by the SWHS software. Only the leaf modules in the hierarchy have to be implemented. If a dash (-) is shown, this means that the module is not a leaf and will not have to be implemented. Whether or not this module is implemented depends on the programming language selected.

5.1 Hardware Hiding Modules (M??)

Secrets: The data structure and algorithm used to implement the virtual hardware.

Services: Serves as a virtual hardware used by the rest of the system. This module provides the interface between the hardware and the software. So, the system can use it to display outputs or to accept inputs.

5.2 Behaviour-Hiding Module

Secrets: The contents of the required behaviors.

Services: Includes programs that provide externally visible behavior of the system as specified in the software requirements specification (SRS) documents. This module serves as a communication layer between the hardware-hiding module and the software decision module. The programs in this module will need to change if there are changes in the SRS.

$5.2.1 \quad \text{Food (M2)}$

Secrets: The structure of the Food

Services: generates and stores a Food object in a random position

5.2.2 PowerUp (M7)

Secrets: The format and structure of the Power up

Services: generates and stores a powerup object in a random position

5.2.3 PlayMap (M6)

Secrets: The format of the game board

Services: updates state of the game board and returns objects to be displayed

5.2.4 MainMenu (M5)

Secrets: The format and and state update redirection of the backend

Services: emulates the game window and different states and menus

5.2.5 Snake (M8)

Secrets: The behaviour of the Snake object

Services: defines the points of the snake and has functions to manipulate snake

5.3 Software Decision Module

Secrets: The design decision based on mathematical theorems, physical facts, or programming considerations. The secrets of this module are *not* described in the SRS.

Services: Includes data structure and algorithms used in the system that do not provide direct interaction with the user.

6 Traceability Matrix

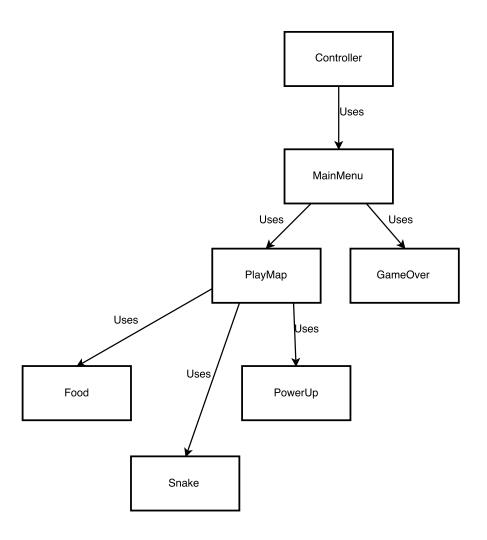

This section shows the traceability matrix between the modules and the requirements.

| Req. | Modules |
|------|----------------|
| R1 | M2 |
| R2 | M2, M8 |
| R3 | M2,M5,M6,M7 |
| R4 | M3, M6, M7 |
| R5 | M2 |
| R6 | M2,M5,M6,M7 |
| R7 | M2,M3,M4,M5,M6 |
| R8 | M2,M4, M5 |

Table 3: Trace Between Requirements and Modules

7 Use Hierarchy Between Modules

In this section, the uses hierarchy between modules is provided.

8 Course Schedule

In this section, a Gantt and PERT Chart scheduling the remainder of the semester are provided.

Snake Nov 6, 2015

McMaster, CAS Department

Project manager Project dates

Project dates Nov 3, 2015 - Dec 8, 2015

Remake of the classic arcade game snake, in python.
